(a) Confidence changes

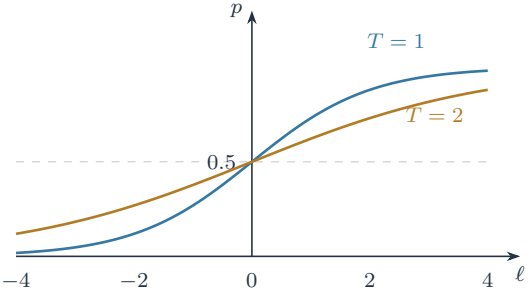

Illustration. T is fitted by calibration-set NLL.

(b) All signed gains share one positive scale

Pair logits $[-2, \quad 1, \quad 3]$

same signs and order

$T = 2 \Rightarrow [-1, \quad 0.5, \quad 1.5]$

$\Delta_T(A, B) = \Delta_1(A, B)/T$

Fixed gates; unsaturated logits; zero cutoff; fixed ties.
Clipping and finite tolerance require separate checks.
